

AI for Smarter Health Care Policy and Contract Management

Presented by :

Shivam Shinde

What We Mean by Content Management

Clinical Guidelines

Long, clinician-oriented documents that are hard to search for or summarize for non-clinical stakeholders who still need to reference them

Payer-Provider Contracts

Lengthy legal agreements between health care provider and a payer defining reimbursement and obligations

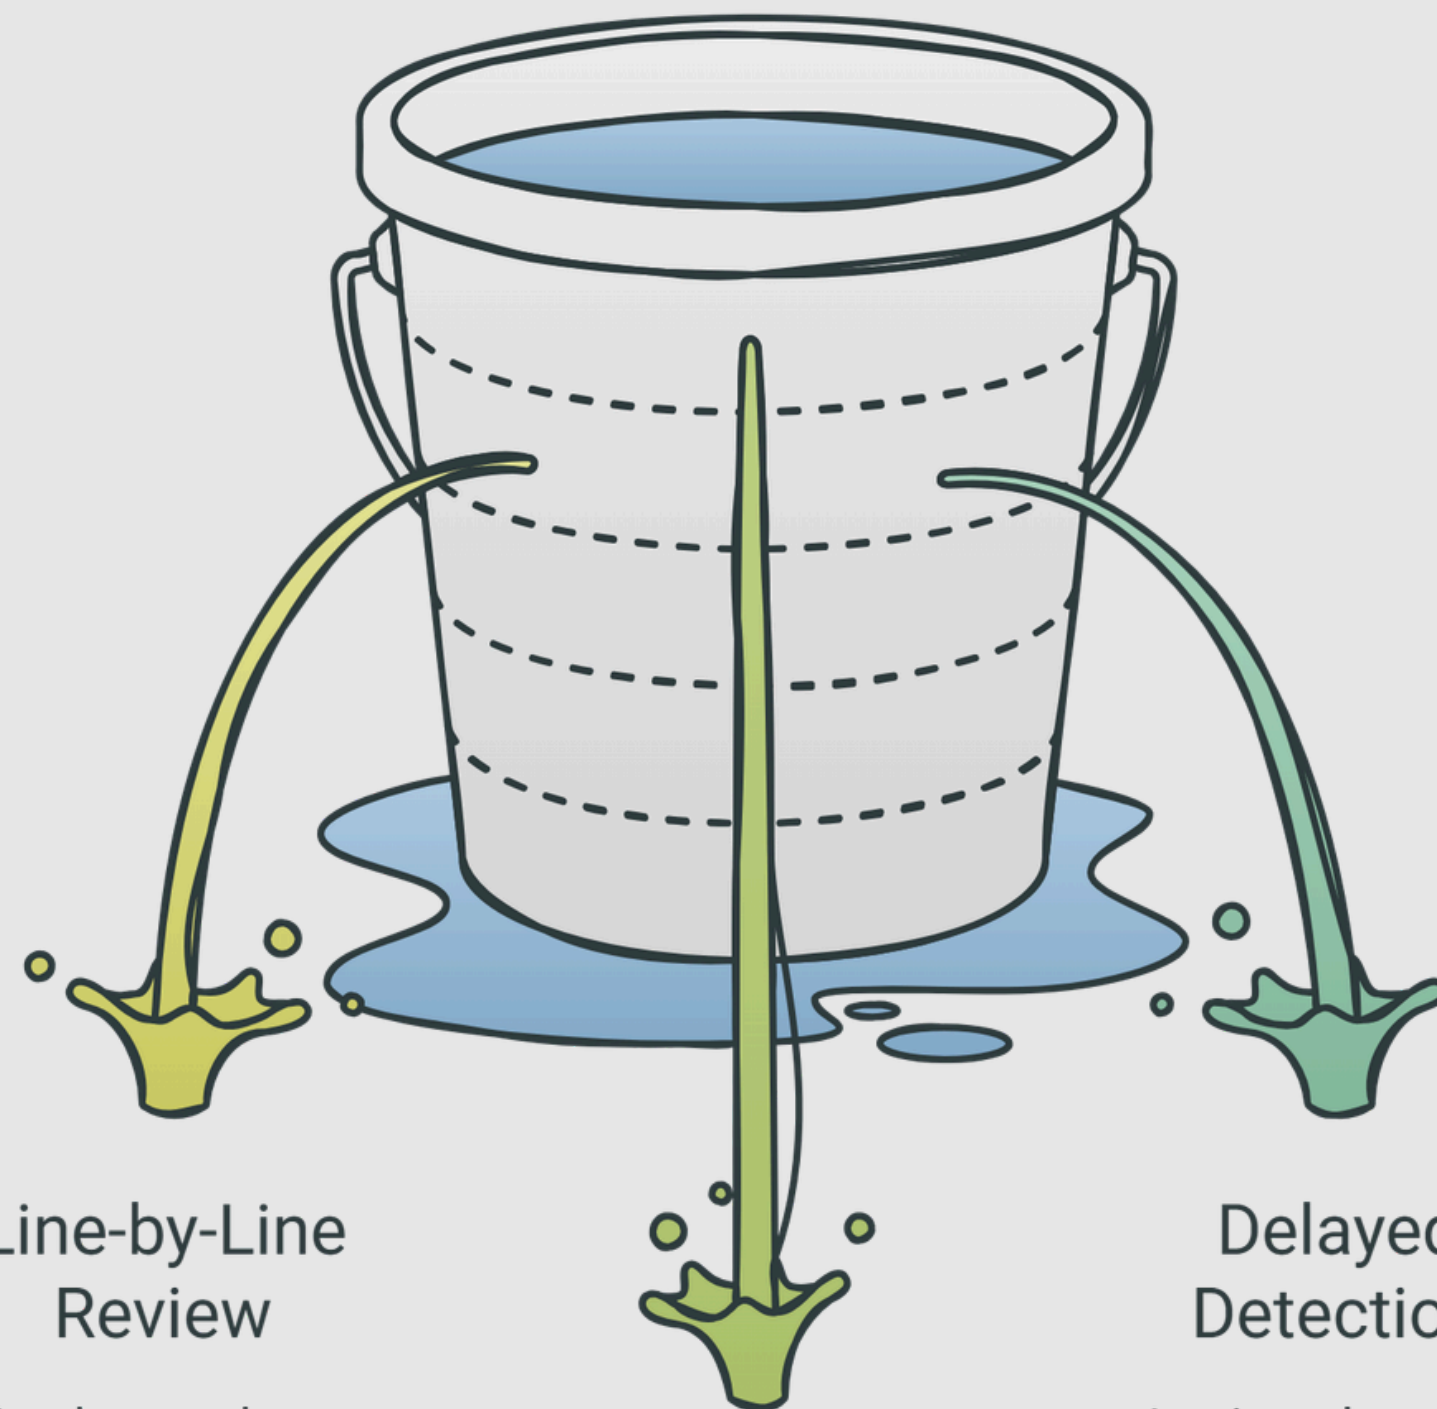

Billing and Coding Policies

Define how services translate into reimbursable codes and change often enough that keeping internal systems current is a constant task.

Operationalization

Converting plain-English policy into executable claims rules or model features

Line-by-Line Review

Analysts rely on basic keyword search and manual document comparison tools which is slow and inconsistent

Interpretation Variance

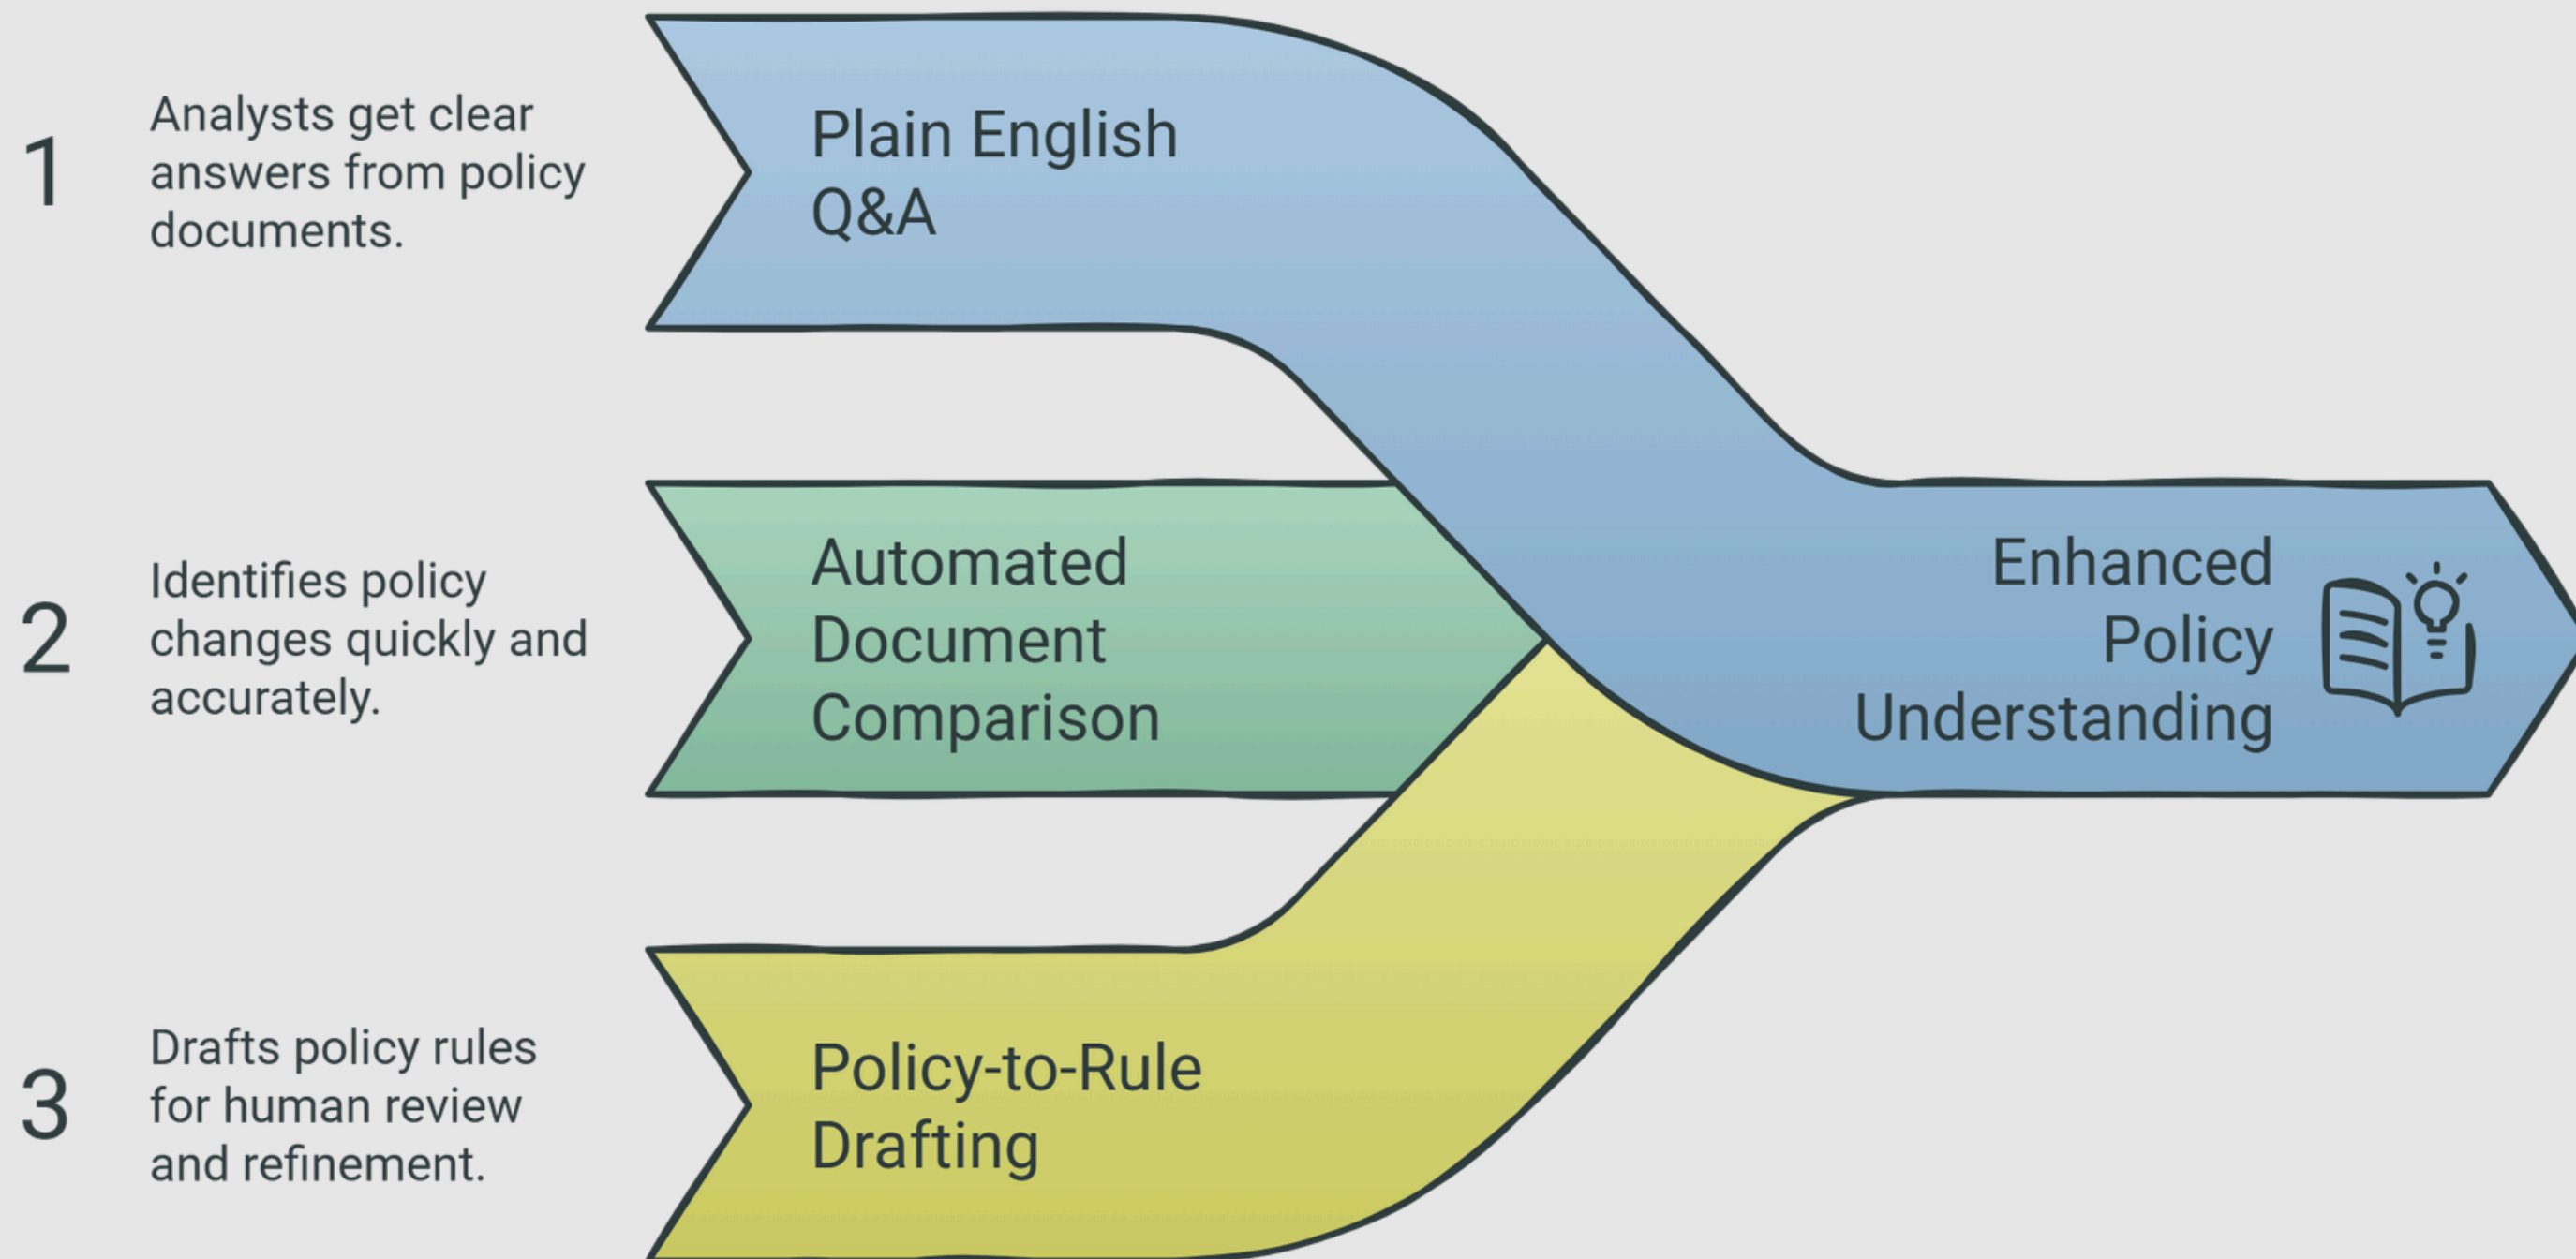

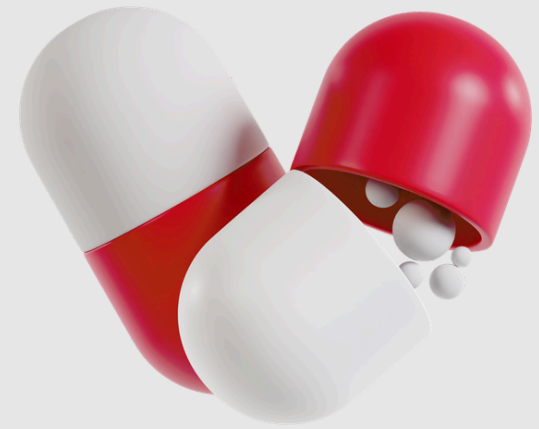

Two analysts can read the same ambiguous language differently, producing conflicting outcomes.

Delayed Detection

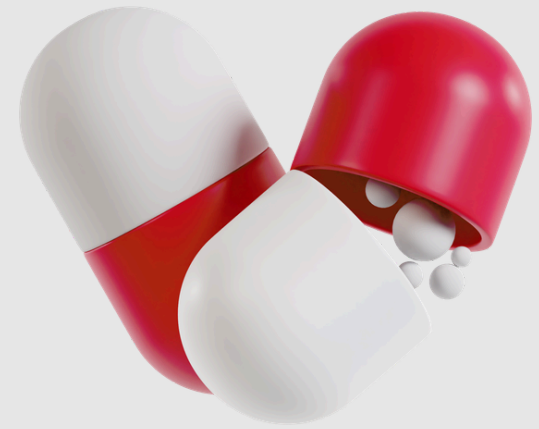

A missed update can leave a claims system running outdated rules for weeks before anyone notices.

The Manual Bottleneck Today

Opportunities with Retrieval Augmented Generation (RAG)

Threats and Obstacles

About This Proposal

This proposal draws from the author's professional experience in AI and health care technology:

Worcester Polytechnic Institute

Built a fine-tuned LLM and RAG system for a non-profit resource-sharing platform as an AI Engineer.

Fallon Health

Designed and deployed a multi-agent LLM framework for document-based Q&A, improving informational access by 45% as an IT Intern.

Claude (Anthropic) assisted with research organization and writing clarity. All sources verified and cited.

THANK

YOU
